Experiment 1: Create a Simple Event Registration Form using HTML & JavaScript

Aim:

To create a basic event registration form using HTML and JavaScript.

Procedure:

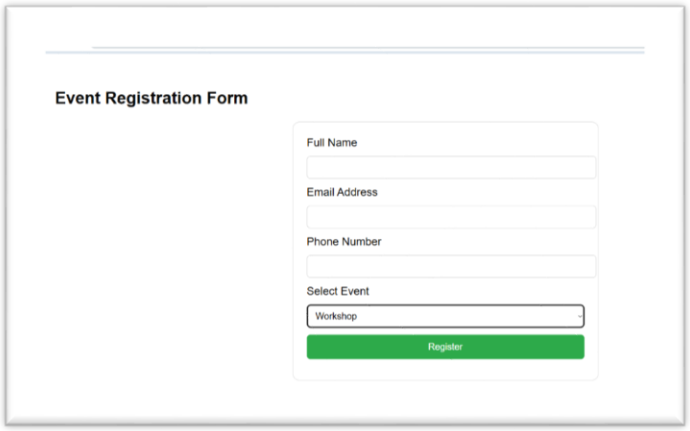

1. Open Visual Studio Code.
2. Create a new HTML file and copy the given code into it.
3. Save and run the file in a browser to test the form.

Code:

```
<!DOCTYPE html>
<html>
<head><title>Event Registration</title></head>
<body>
<form id="registrationForm" onsubmit="return validateForm()">
<label for="name">Full Name</label>
<input type="text" id="name" required>
<label for="email">Email</label>
<input type="email" id="email" required>
<label for="phone">Phone Number</label>
<input type="tel" id="phone" required pattern="[0-9]{10}">
<label for="event">Select Event</label>
<select id="event" required>
<option value="">--Select--</option>
<option value="workshop">Workshop</option>
<option value="seminar">Seminar</option>
<option value="conference">Conference</option>
</select>
<button type="submit">Register</button>
</form>
<script>
function validateForm() {
  const phone = document.getElementById('phone').value;
  if (!/^\d{10}$/.test(phone)) {
    alert('Invalid phone number');
    return false;
  }
  alert('Registration Successful!');
  return true;
```

```
}
</script>
</body>
</html>
```

Output

Experiment 2: Explore Git and GitHub Commands

Aim:

To explore basic Git and GitHub commands.

Procedure:

Git and GitHub are two of the most popular tools used for version control and collaboration in software development.

Here are some common Git and GitHub commands:

- Initializing a Git repository: $ git init
- Checking the status of your repository: $ git status
- Adding files to the stage: $ git add <file-name>
- Committing changes: $ git commit -m "commit message"
- Checking the commit history: $ git log
- Undoing changes: $ git checkout <file-name>
- Creating a new branch: $ git branch <branch-name>
- Switching to a different branch: $ git checkout <branch-name>
- Merging two branches: $ git merge <branch-name>
- Pushing changes to a remote repository: $ git push origin <branchname>
- Cloning a repository from GitHub: $ git clone <repository-url>

Creating a pull request on GitHub: Go to the repository on GitHub, select the branch you want to merge and click the "New pull request" button.

These are just a few of the many Git and GitHub commands available. There are many other Git commands and functionalities that you can explore to suit your needs.

Experiment 3: Practice Source Code Management on GitHub

Aim:

To push and manage source code using GitHub.

Procedure:

To practice source code management on GitHub, you can follow these steps:

Create a GitHub account if you don't already have one.

- Create a new repository on GitHub.
- Clone the repository to your local machine: $ git clone <repositoryurl>
- Move to the repository directory: $ cd <repository-name>
- Create a new file in the repository and add the source code written in exercise 1.
- Stage the changes: $ git add <file-name>
- Commit the changes: $ git commit -m "Added source code for a simple user registration form"
- Push the changes to the remote repository: $ git push origin master

Verify that the changes are reflected in the repository on GitHub.

These steps demonstrate how to use GitHub for source code management. You can use the

same steps to manage any source code projects on GitHub. Additionally, you can also explore

GitHub features such as pull requests, code review, and branch management to enhance your

source code management workflow.
